

StockPulse

Budget-aware purchasing decisions retailers can understand.

From scattered supplier updates to an approved purchase order, in one connected workflow.

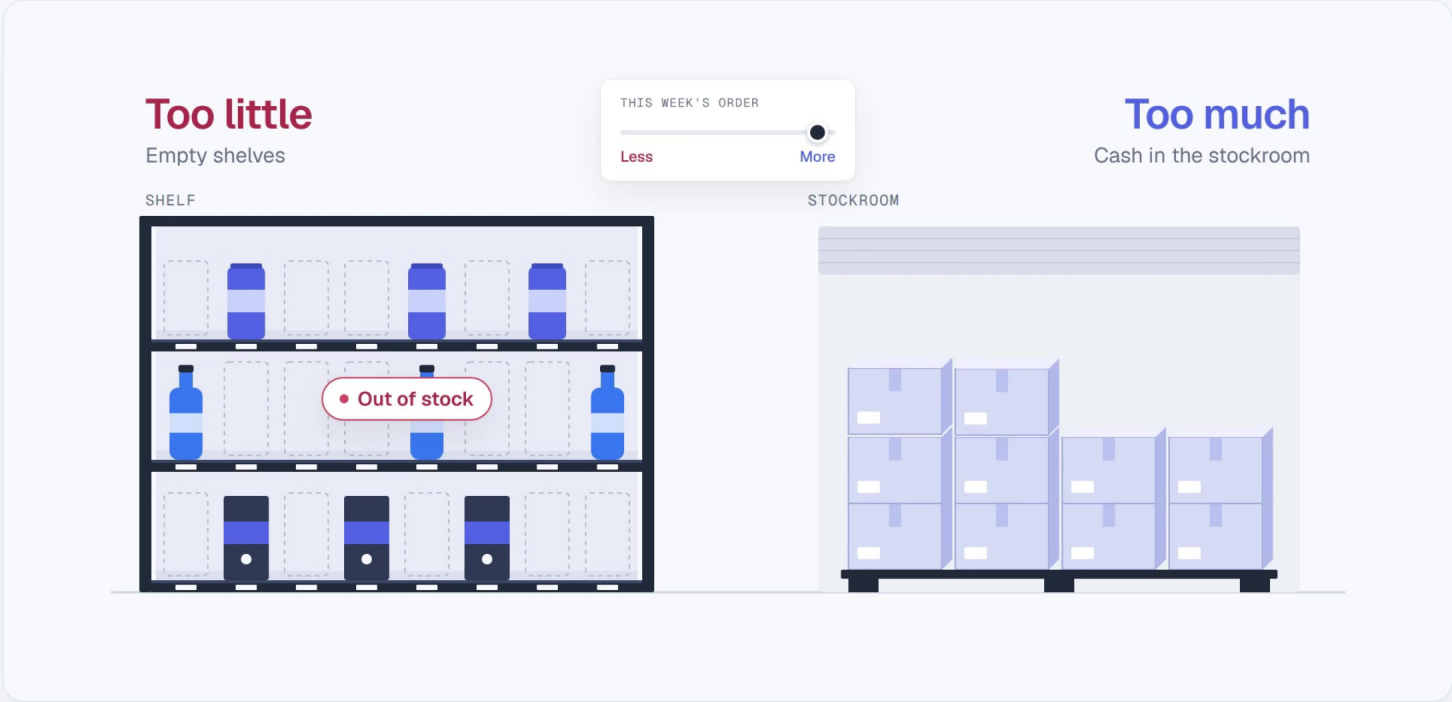

Every retailer makes the same weekly bet.

Order too little

Customers find empty shelves.

Order too much

Cash gets trapped in stock that may never sell.

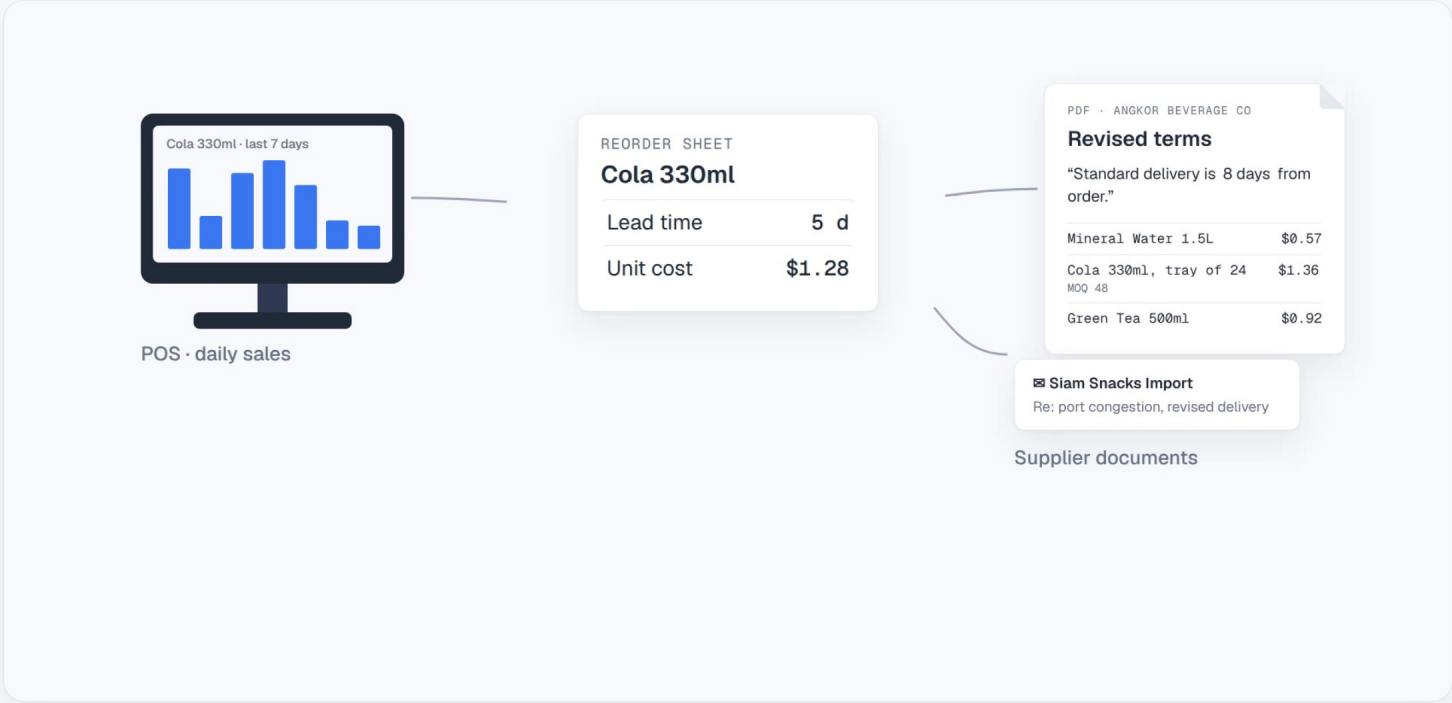

THE PROBLEM

The signals that matter are scattered.

Sales sit in the POS. Supplier updates arrive through spreadsheets, PDFs and emails.

A delayed delivery or an overlooked price increase changes what a retailer should order, and is easy to miss.

Without connecting these signals, purchasing becomes a costly guessing game.

WHY IT MATTERS

That gap is costly.

STOCKOUT

2.3

days: Cola sells out before the delayed truck arrives.

TRAPPED CAPITAL

$42,775

in stock beyond 90 days of cover.

MARGIN EROSION

$1.14

Cola margin per can, down from $1.22 after the cost rise.

INTRODUCING STOCKPULSE

StockPulse turns scattered supplier updates, demand forecasts and stock risks into precise, budget-aware purchasing decisions.

Let’s follow one purchasing scenario: Cola 330ml, after its supplier changes the terms.

STEP 1 · SUPPLIER DOCUMENTS

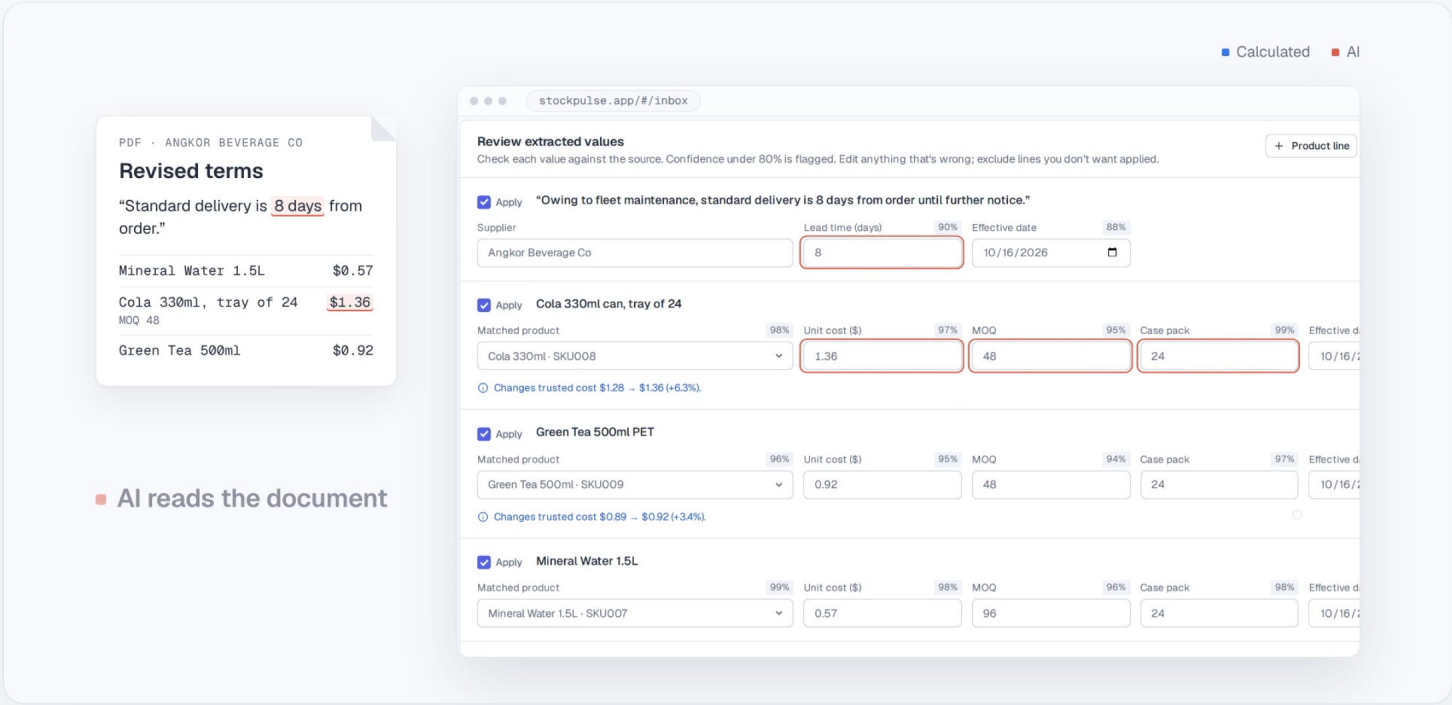

A supplier update becomes structured data.

5 → 8 days

Cola lead time in the revised terms, plus a unit cost rise from $1.28 to $1.36.

The changes are extracted into fields and held for human review. Nothing changes until someone confirms.

EXTRACTION SIMULATED

STEP 2 · DEMAND FORECAST

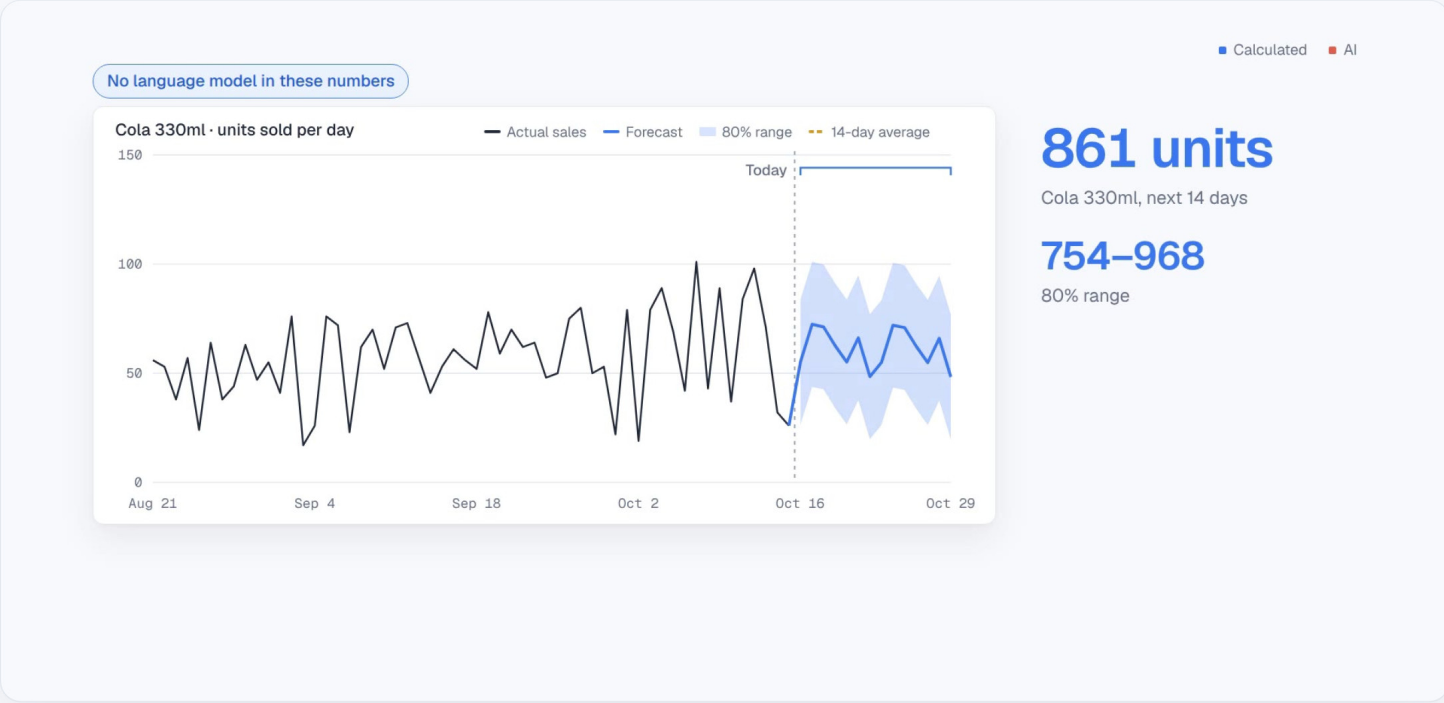

Time-series models forecast future demand.

861 units

Cola, next 14 days · 80% range 754–968

Predictions are compared with a 14-day moving-average baseline (879), so retailers can act before a shortage becomes urgent.

No language model touches these numbers.

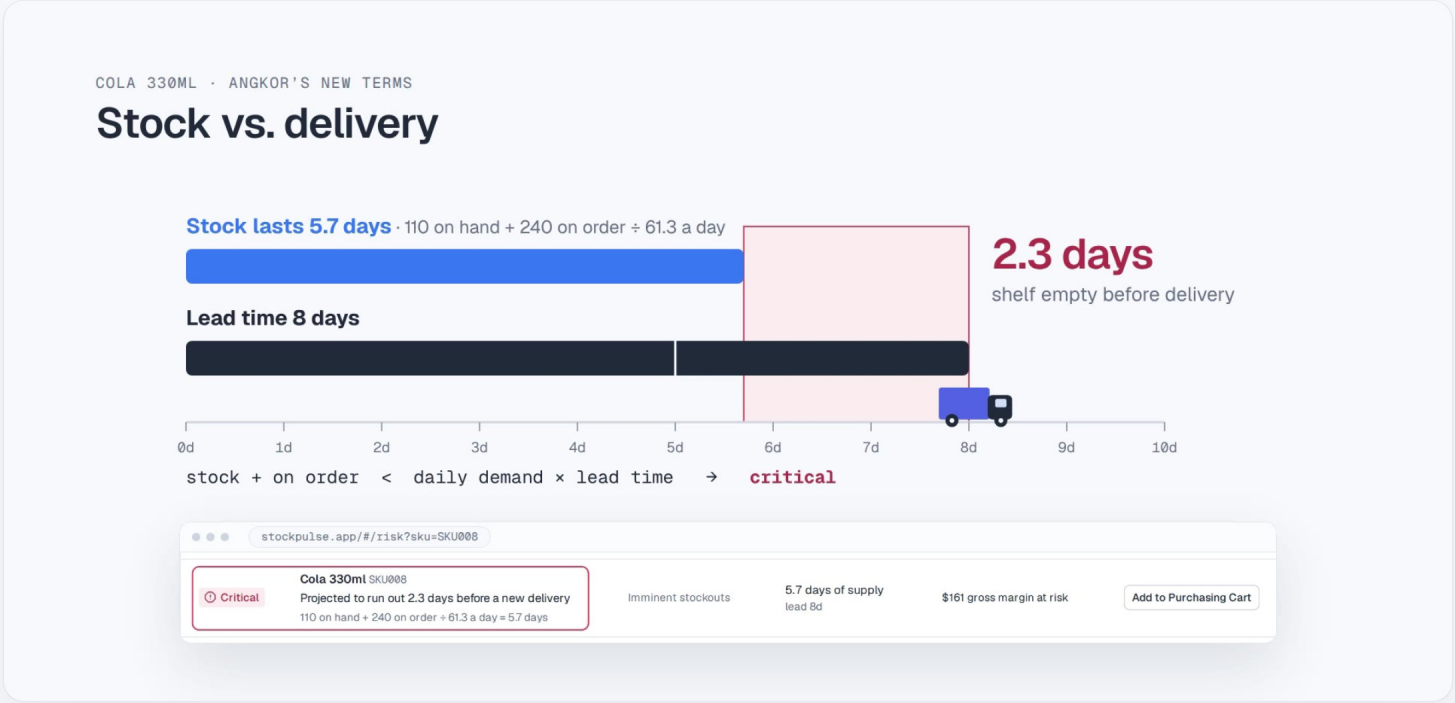

STEP 3 · STOCK RISK

Stock runs out before the next delivery.

2.3 days

short of the delayed delivery · flagged Critical

5.7 days of supply against an 8-day lead time. Fixed rules combine inventory and lead time to flag the products that need attention.

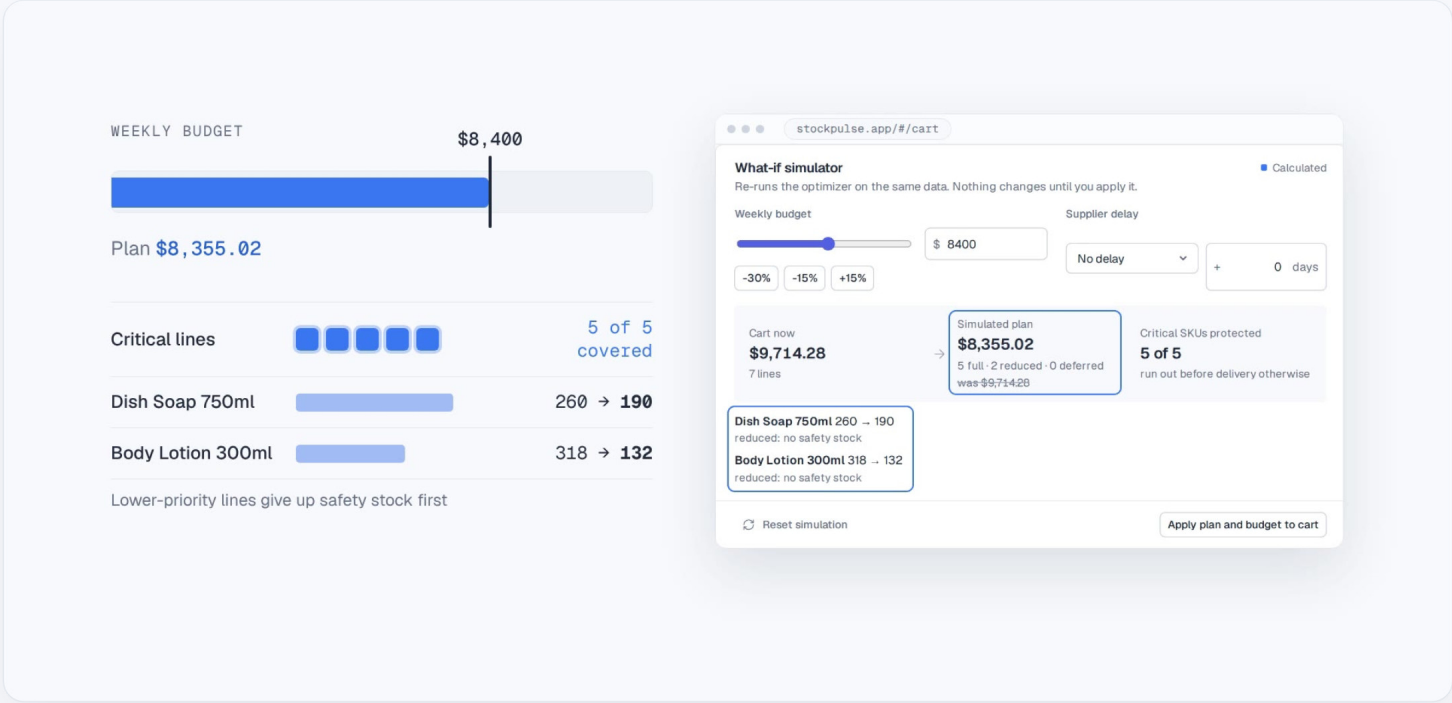

STEP 4 · REPLENISHMENT

Every quantity has a reason behind it.

744 units

486 + 429 + 174 − 350 (stock and on order), rounded to case 24 / MOQ 48

Budget cut 30% to $8,400: the plan fits at $8,355.02, with 5 of 5 critical lines protected.

STEP 5 · AGENT AND APPROVAL

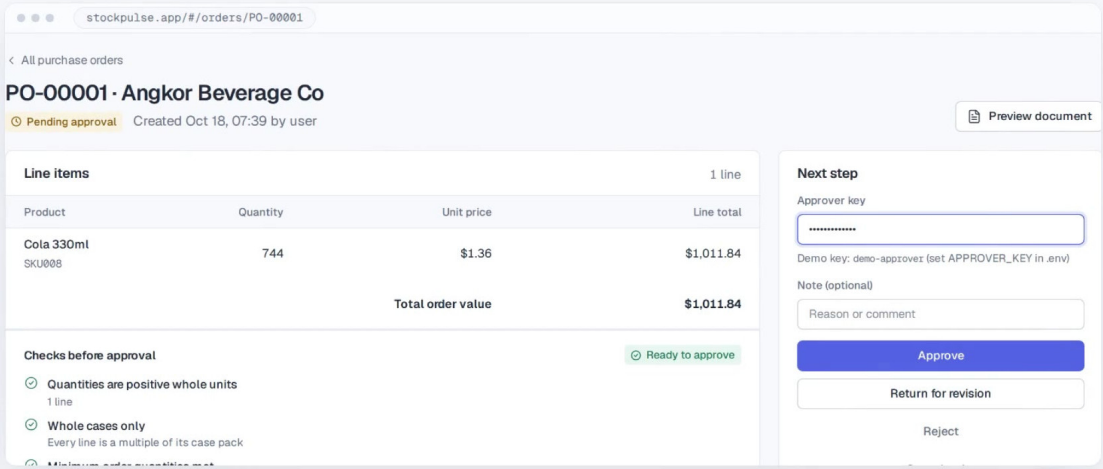

The agent drafts. The retailer decides.

$1,011.84

PO-00001 · Cola 744 × $1.36

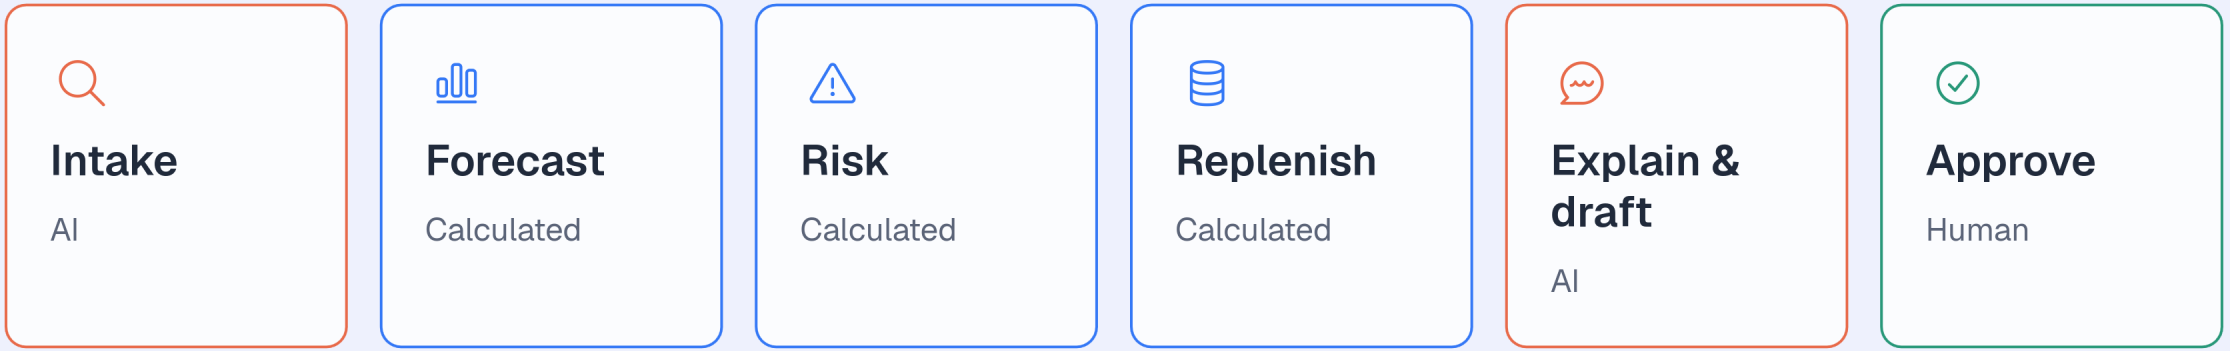

The procurement agent explains the calculation and drafts the purchase order. It cannot approve: a person with an approver key makes the final call.

AGENT MODEL PLANNED

ONE CONNECTED WORKFLOW

From supplier documents to an approved order.

BUILT FOR

Independent retailers, specialty grocers and small wholesalers working with POS data and spreadsheets.

ARCHITECTURE

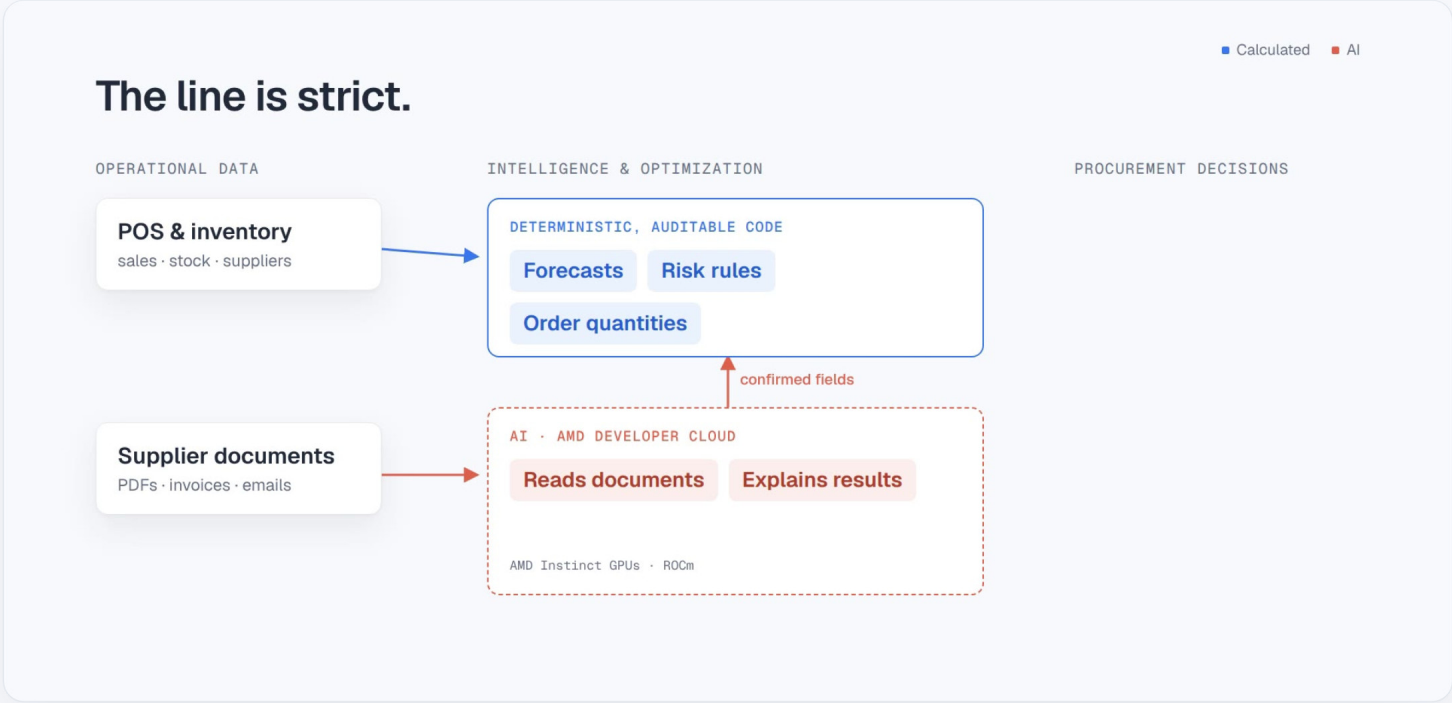

AI combined with dependable business logic.

Language models interpret documents and explain recommendations.

Deterministic code calculates forecasts, risk and order quantities.

Designed for AMD Instinct GPUs and ROCm, with privacy and access controls built in.

AMD DEPLOYMENT PLANNED

Fewer empty shelves.
Less cash tied up in excess stock.
Smarter purchasing, with decisions retailers can understand.

This is StockPulse.
